Skills

Software Engineering	software architecture, backend services, distributed systems, API design, data modeling, testing
Cloud & DevOps	GCP, AWS, Docker, Kubernetes, Terraform, Cloud Build, CI/CD, monitoring & alerting
Languages & Frameworks	Python, Java, Spring, Scala, TypeScript, SQL, Bash, Git
Data Systems	relational databases, document stores, object storage, open table formats, message brokers

Experience

Software Engineer — **08.2023 — Present**
ELCA Engineering — *Lausanne, Switzerland*

- Productionized a delivery simulation platform (Python, Docker, AWS ECS). Implemented a resource allocation algorithm (0/1 knapsack with pluggable objective functions). Estimated annual savings: CHF 3M
- Built the finance data migration subsystem for a social insurance product end-to-end (Java Spring, SQL Server, dbt, OKD). Scaled from 10k to 1M+ records through database tuning (indexing, logging, procedure optimization) and Spring Batch parallelism
- Migrated critical financial data pipelines from a legacy Azure service to Databricks without downtime and without regression. Reduced runtime by 60% and cut infrastructure cost by 20% (Python, PySpark, Terraform)
- Designed and deployed a real-time delivery data platform (Kafka, Scala Spark, dbt, Athena) tracking 10k postal teams with Iceberg tables, automated data quality tests, and CI/CD via GitHub Actions

Data Engineer — **10.2022 — 07.2023**
UBS — *Lausanne, Switzerland*

- Contributed to the internal ETL framework (Python, Jenkins): maintained the Kafka connector and built a workflow generation tool converting YAML definitions to orchestration jobs, saving 500+ hours of manual setup
- Operated 500 data pipelines processing ~1 TB/day (custom ETL + Scala Spark) under strict regulatory SLAs with on-call

Data Scientist — **04.2021 — 07.2022**
Logitech — *Lausanne, Switzerland*

- Developed a production NLP pipeline (AWS Lambda → Snowflake) processing ~100k customer reviews: API ingestion, language identification, translation, and sentiment analysis using Hugging Face pretrained models. ~500 weekly internal users
- Designed and implemented the team's CI/CD deployment architecture: containerized Python apps, automated builds with GitHub Actions, deployed on ECS and EKS. Four ML models shipped through this framework
- Shipped ML models as containerized ECS jobs serving predictions through Snowflake: shipment delay estimator with custom asymmetric loss, time series forecaster, and interpretable financial predictor

Data Scientist — **06.2019 — 03.2021**
Crédit Mutuel Leasing — *Paris, France*

- Engineered a residual car value prediction model that replaced a ~EUR 100k/year external vendor. Chose interpretable linear regression, enabling direct integration into the business application
- Developed a business partner classification model using ensemble methods, improving accuracy by 15 percentage points and partially automating a monthly review of 4,000 partners

Math Teacher (secondary school) — **01.2014 — 03.2019**

Projects

Self-Hosted LLM Assistant — **Blog post**

- Built a private alternative to ChatGPT with Angular, Spring Boot and Gemma 3 via Ollama, deployed on Google Cloud Run
- Built the Angular frontend: reactive state management (signals), markdown rendering, client-side conversation handling

Education

Master in Statistics & Data Science, *Paris Institute of Statistics, Sorbonne University* — 2019 — 2020

Master in Software Engineering, *Institut Mines-Télécom, France* — 2008 — 2013
