SKILLS

Software Engineering	backend services, distributed systems, API design, software architecture, web applications, testing
Cloud & DevOps	GCP, AWS, Docker, Kubernetes, infrastructure as code, CI/CD, monitoring & alerting
Languages & Frameworks	Python, Java, Spring, Scala, TypeScript, SQL, Linux
Data Systems	relational databases, message brokers, document stores, data warehouses

EXPERIENCE

Software Engineer <i>ELCA Engineering</i>	08.2023 — Present <i>Lausanne, Switzerland</i>
- Productionized a delivery simulation platform (Python, Polars, OR-Tools, Terraform, AWS Athena/SageMaker). Implemented a resource allocation algorithm (0/1 knapsack with pluggable objective functions). Estimated annual savings: CHF 3M - Built the finance data migration subsystem for a social insurance product end-to-end (Java Spring, SQL Server, dbt, OKD). Scaled from 10k to 1M+ accounts through database tuning (indexing, logging, procedure optimization) and Spring Batch parallelism - Migrated critical financial pipelines from a legacy Azure service to Databricks without downtime or regressions. Built a custom testing framework. Reduced runtime by 60% and infrastructure cost by 20% (Python, PySpark, Terraform) - Built a near-real-time backend system ingesting delivery events from 10k postal teams via Kafka, with Scala Spark processing, Iceberg storage on Athena, automated data quality checks, and CI/CD via GitHub Actions	
Data Engineer <i>UBS</i>	10.2022 — 07.2023 <i>Lausanne, Switzerland</i>
- Contributed to the internal ETL framework (Python, Jenkins): maintained the Kafka connector and built a workflow generation tool converting YAML definitions to orchestration jobs, saving 500+ hours of manual setup - Developed or operated 500 data pipelines (custom ETL + Scala Spark) under strict regulatory SLAs with round-robin on-call	
Data Scientist <i>Logitech</i>	04.2021 — 07.2022 <i>Lausanne, Switzerland</i>
- Built a production ML pipeline (AWS Lambda → Snowflake) processing ~100k customer reviews: API ingestion, language identification, translation, and sentiment analysis using Hugging Face pretrained models. ~500 weekly internal users - Designed and implemented the team's CI/CD deployment architecture: containerized Python apps, automated builds with GitHub Actions, deployed on ECS and EKS - Shipped ML models serving predictions through the data warehouse: shipment delay estimator with custom asymmetric loss (XGBoost), time series forecaster (PyTorch), and interpretable financial predictor	
Data Scientist <i>Crédit Mutuel Leasing</i>	06.2019 — 03.2021 <i>Paris, France</i>
- Engineered a residual car value prediction model that replaced a ~EUR 100k/year external vendor. Chose interpretable linear regression, enabling direct integration into the business application - Developed a business partner classification model using ensemble methods, improving accuracy by 15 percentage points and partially automating a monthly review of 4,000 partners	
Math Teacher (secondary school)	01.2014 — 03.2019

PROJECTS

Self-Hosted LLM Assistant	Blog post
Built a private alternative to ChatGPT with Angular, Spring Boot and Gemma 3 via Ollama, deployed on Google Cloud Run with Firestore persistence and service-to-service authentication	

EDUCATION

Master in Statistics & Data Science, Paris Institute of Statistics, Sorbonne University	2019 — 2020
Master in Software Engineering, Institut Mines-Télécom, France	2008 — 2013
